Rationale

“The prevalence of pre-diabetes was 37% to 38% in the overall population, and consequently 49% to 52% of the population was estimated to have either diabetes or pre-diabetes.”

The chronic care model guides our team-based approach to diabetes management

Numerous interventions to improve adherence to the recommended standards have been implemented. However, a major barrier to optimal care is a delivery system that is often fragmented, lacks clinical information capabilities, duplicates services, and is poorly designed for the coordinated delivery of chronic care. The chronic care model (CCM) has been shown to be an effective framework for improving the quality of diabetes care (3,5).

Six core elements

The CCM includes six core elements for the provision of optimal care of patients with chronic disease:

1. Delivery system design (moving from a reactive to a proactive care delivery system where planned visits are coordinated through a team-based approach)

2. Self-management support

3. Decision support (basing care on evidence-based, effective care guidelines)

4. Clinical information systems (using registries that can provide patient-specific and population-based support to the care team)

5. Community resources and policies (identifying or developing resources to support healthy lifestyles)

6. Health systems (to create a quality-oriented culture)
Pre-diabetes

Pre-diabetes screening pathway

Screen all adults ≥45 years old q 3 yr

Test all adults with BMI ≥30 with ≥1 risk factor q 1 yr

Prediabetic FBG 100-125 or 2h PP glucose 140-199

Care Management Program
1:1 counseling
Care Coordination
Medication management
Referral to community resources

Risk factors
BP >139/89
HDL <35
Triglycerides >250
Hx cardiovascular disease
Cognitive impairment
FH of DM
Hx GDM or delivered baby >9 pounds
Physical activity <30 min/day, 5 d/wk

Diagnosis of pre-diabetes
1. FPG 100-125 g/dL
2. Hemoglobin A1c 5.7 – 6.4%

*Provider should make sure to use the correct screening diagnosis to allow for accurate reimbursement.

<tbody>
<tr>
<td>MEET</td>
<td>-TS</td>
<td>V77.1</td>
<td>To indicate that the purpose of the test(s) is diabetes screening for a beneficiary who meets the definition of prediabetes. The screening diagnosis code V77.1 is required in the header diagnosis section of the claim and the modifier “TS” (follow-up service) is to be reported on the line item.</td>
</tr>
</tbody>
</table>

IMPORTANT NOTE: The Centers for Medicare and Medicaid Services (CMS) monitors the use of its preventive and screening benefits. By correctly coding for diabetes screening and other benefits, providers can help CMS more accurately track the use of these important services and identify opportunities for improvement. When submitting a claim for a diabetes screening test, it is important to use diagnosis code V77.1 and the “TS” modifier on the claim as indicated above, along with the correct HCPCS/CPT code, so that the provider/supplier can be reimbursed correctly for a screening service and not for another type of diabetes testing service.

Medicare beneficiaries who have any of the following risk factors for diabetes are eligible for this screening benefit:
- Hypertension
- Obesity (a body mass index equal to or greater than 30 kg/m2)
- Dyslipidemia
- Previous identification of elevated impaired fasting glucose or glucose tolerance

OR

Medicare beneficiaries who have a risk factor consisting of at least two of the following characteristics are eligible for this screening benefit:
- A family history of diabetes
- Overweight (a body mass index greater than 25, but less than 30 kg/m2)
- Age 65 years or older
- A history of gestational diabetes mellitus or of delivering a baby weighing greater than 9 pounds
Treatment of pre-diabetes
1. Diet/lifestyle modifications or metformin
2. Obesity management

Diabetes

Screening for type 2 diabetes
1. All adults age 45 and above
2. Adults with two or more risk factors (one risk factor obesity)
   a. Overweight or obesity
   b. Sedentary lifestyle
   c. First degree relative with diabetes
   d. Native American, African American, Latino, Pacific Islander
   e. Hypertension
   f. ASCVD
   g. Gave birth to infant > 4kg (8.8 lbs.)
   h. History of gestational diabetes
   i. HDL < 35 or triglycerides >250
   j. PCOS or acanthosis nigricans

Diagnosis
1. FPG > 126 g/dL
2. 2 hr oral GTT glucose > 200 g/dL
3. Random glucose > 200 g/dL
4. Hemoglobin A1c = or > 6.5%

Treatment goal
1. Hemoglobin A1c < 8% for 85% of adult population
2. Patient goals should be included in care plan
Hemoglobin A1c testing frequency
1. Every six months if at goal
2. Every three months if not at goal

Cardiovascular risk factor management
1. All patients with diabetes should have cardiovascular risk assessment annually
2. Hypertension control < 140/90
3. Statin for all diabetic patients > 40 years and under 40 if other CV risk factors
4. Baby aspirin recommended for patients with increased CV risk (>10% over 10 years)
5. Tobacco cessation counseling and treatment

Other screening and prevention
1. Screen for nephropathy annually and treat with ACE Inhibitor when GFR < 60 and microalbuminuria
2. Retinal screen annually
3. Foot exam annually
4. Tobacco cessation screen annually

Referral
1. Consultation with nephrologist for all patients with GFR < 45 (stage 3b) and sooner if rapid progression
2. Ophthalmology referral for all patients with retinopathy
Patient education materials shall be given for all newly diagnosed patients and as needed

Referral to diabetes program/education class
1. Hemoglobin A1c > 8%
2. Patient request to achieve goals

Source: 2016 AACE/2016 ADA
Care coordination enrollment/assessment
1. Diabetes and acute hospitalization/emergency department visit
2. Uncontrolled diabetes and/or 3 chronic conditions and diabetes
3. Recurrent hypoglycemia
